

In 2017 I was introducing my discovery at the Chinese entrepreneurial conference in San Francisco. I met a gentleman who said he knew someone who could help me with my efforts.

A few days later Scott flew to the Bay Area to meet with me. We spent three days together discussing my discovery.

My discovery pertained to the use of a cryptography solution for a specific sector. I had demonstrated deep expertise in this domain solving a very difficult problem.

When Scott realized and trusted I had this discovery, he informed me it had implications for use in other sectors, such as finance, polling, media, currency, voting and others beyond the sector to which the discovery was achieved. Scott and I spent hours, days, months and years creating the viability and relevance possibilities for its applications.

I have since filed for a patent for this solution across the world. It has been granted in (IN, US and CHINA) and pending approval in EU. Granted by USPTO is a testament to the utility, non-obviousness and novelty of the solution.

Our interaction and developments in this domain opened the door to exploring various other sectors where this transitional innovative approach could be leveraged. Currently, Scott and I are happy to and confident in applying the possibilities and opportunities in the electorate, media and currency sectors. Our discussions clearly establish a mandate for creating a solution for a verifiable, inclusive and accessible online voting solution as a current priority, for which you have myself and Scott's commitments.

I can't thank Scott enough for being a personal mentor and friend during my brain work to establish a product and products that benefit the world for good.

Regards
